HIP 24679

One light among many

Some nights begin when we stop hurrying. The day withdraws, our eyes learn the darkness and, little by little, the stars appear. Among them is HIP 24679. Until now it may have been another distant light; pausing to look is the beginning of giving it a place in our own story.

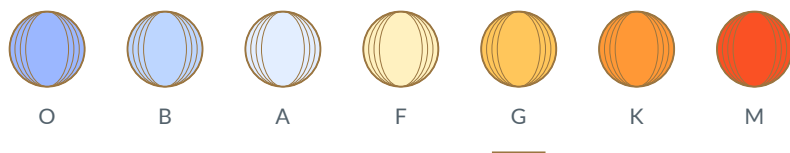

A dedication begins with that simple gesture: choosing something beautiful and wanting to share it. The star will continue on its way, beyond our calendars, while here below its light can accompany a date, a name or words we wish to keep. Immensity takes on an intimate measure: the measure of what matters to us.

The colour of its fire

The light of HIP 24679 has a character of its own. The G family feels familiar because the Sun belongs to it too. We can imagine a brightness related to the light entering a window and accompanying our days. Elsewhere in the sky, matter has found a way to shine that reminds us of home.

To the unaided eye, a stellar colour can be little more than a whisper. The atmosphere makes it tremble and our eyes receive it in their own way. Beyond that point we can imagine a living surface of hot matter: the visible beauty of processes working on a scale far greater than ours.

SEVEN FAMILIES OF LIGHT

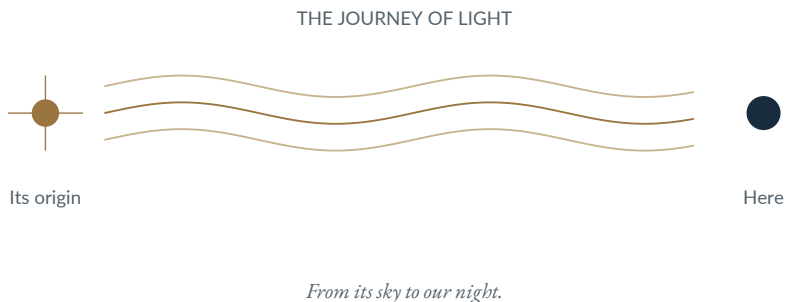

Light keeps the colours of its origin.

The journey ending here

The light of HIP 24679 crosses approximately 157.6 light-years to reach us. The brightness we receive has therefore spent about 157.6 years on its way. Distance becomes time: looking at this star means meeting light that began travelling before this moment. When it set out, the Sun and its planets already shared a history billions of years old. On their scale, this journey is barely a breath.

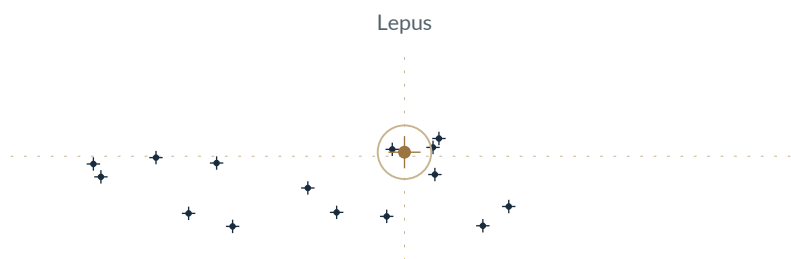

Its light has crossed the time of several generations. We can imagine hands writing letters, lit windows and voices that now live only in other voices. Through all that passing on, the brightness kept travelling; tonight it reaches us.

A landscape for imagination

HIP 24679 lies in the region of the Hare. The Hare brings a moment of lightness. In our imagination, its run crosses the sky like a brief joy that begins to move again whenever we remember it.

Figures in the sky are a human way of approaching immensity. In our gaze they join lights that may lie at very different distances. Imagination stretches the thread; the stars provide the brightness. A single landscape can therefore keep old images while receiving a story that begins tonight.

Its light, among other lights of the constellation.

A star in the history of subgiants

In 2016, Sandage, Beaton and Majewski revisited a question from Mount Wilson: how to distinguish subgiants, stars between giants and dwarfs. Their table compared with Hipparcos the ninety stars that had outlined that sequence in the 1935 study. HIP 24679 appears there as HD 34538: Mount Wilson classified it G9, while Hipparcos gave G8 IV. The article does not provide an individual observing date for this star; 1935 belongs to the collective study.

Its trace is not that of a solitary discovery, but of a recognizable part in a shared history. A catalogue line travels between generations of instruments: first the Mount Wilson spectra, then Hipparcos's precise geometry, and finally the historical account that brings them together. We might look at a life shared in the same way: not as one isolated instant, but as a continuity that different ways of seeing can help us understand.

The threshold of another chapter

A subgiant stands within a transition in its stellar history. The balance that supported a long stage begins to change, and the star responds within both its interior and envelope. We can imagine it on a threshold: still keeping something of what it was, already learning another way to shine.

To approach HIP 24679, we can let that scale widen our imagination. A stellar age is unlike a birthday: it speaks of changing matter, of energy finding a way out, of a balance sustained and transformed. Tonight's light is one page of that time, and we happen to be here to receive it.

Measuring with two glances

To begin measuring a stellar distance, Earth offers us a movement. We observe from one side of its orbit and look again about six months later from the other. A nearby star seems to shift slightly against more distant ones. That small change of perspective is called parallax.

We can feel the principle by looking at a finger with one eye and then the other. What fits between two glances at home requires our planet's journey in the sky. There is something beautiful in that patience: to learn how far a light is from us, we first learned to look from somewhere else.

Nothing stands still

Although it seems still, HIP 24679 belongs to a moving sky. Stars travel through the galaxy and our own home moves with the Sun. The distances are so great that many of these changes need years of observation to become visible. The serenity we see is really keeping a journey.

We can imagine every night as a meeting between travellers. We arrive with one more day of memories; the star arrives with its light and its path. The meeting seems to repeat, yet it is never quite the same. Perhaps that is why looking again can be such a simple way to celebrate shared time.

The night of finding it

We can begin with something simple: looking into a starry sky and letting our eyes grow used to darkness. The dedication page lets us choose a place and time to find where to look. Recognising the constellation first turns a distant map into a familiar landscape.

If a telescope joins the evening, a wide field is a gentle beginning. As a reference, a 114 mm Newtonian with a 500 mm focal length gives 20× with a 25 mm eyepiece. The star remains a point of light; the instrument gathers more of its brightness. The best memory may be the moment we leave the eyepiece and say: there it is.

Somewhere to return

We can close this booklet and let HIP 24679 become a small light in an enormous night again. Something, though, will have changed. We now know part of its journey, a shade of its colour and a way to find it. What seemed far away has a place in our memory.

There will be clear nights and others when clouds keep the sky. Not every night will allow observing, but each can bring back the memory of this gesture. Sometimes a name is enough to return to a date, a voice, a few shared words. And when the light appears again, we will have one more reason to pause and look.
