HIP 6379

One light among many

Some nights begin when we stop hurrying. The day withdraws, our eyes learn the darkness and, little by little, the stars appear. Among them is HIP 6379. Until now it may have been another distant light; pausing to look is the beginning of giving it a place in our own story.

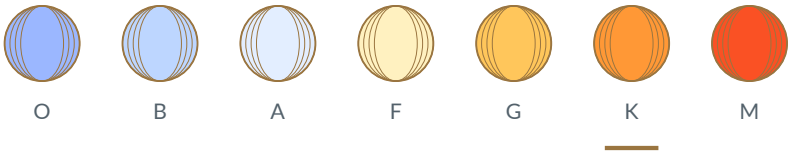

A dedication begins with that simple gesture: choosing something beautiful and wanting to share it. The star will continue on its way, beyond our calendars, while here below its light can accompany a date, a name or words we wish to keep. Immensity takes on an intimate measure: the measure of what matters to us.

The colour of its fire

The light of HIP 6379 has a character of its own. The K family keeps the colour of an ember seen at the end of an evening. Its surfaces are cooler than the Sun's, though still extraordinarily hot. That amber tint suggests a gathered light, a warmth that seems to ask us to stay a little longer.

To the unaided eye, a stellar colour can be little more than a whisper. The atmosphere makes it tremble and our eyes receive it in their own way. Beyond that point we can imagine a living surface of hot matter: the visible beauty of processes working on a scale far greater than ours.

SEVEN FAMILIES OF LIGHT

Light keeps the colours of its origin.

The journey ending here

The light of HIP 6379 crosses approximately 54.9 light-years to reach us. The brightness we receive has therefore spent about 54.9 years on its way. Distance becomes time: looking at this star means meeting light that began travelling before this moment. When it set out, the Sun and its planets already shared a history billions of years old. On their scale, this journey is barely a breath.

Its light travels on something like the scale by which we count a life. While it moved, streets changed, trees grew and many stories found their beginning. In a single glance, the star lets us receive something that has crossed years of the world.

THE JOURNEY OF LIGHT

Its origin

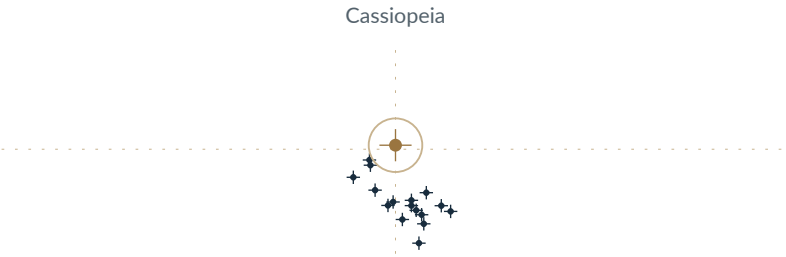

Here

From its sky to our night.

A landscape for imagination

HIP 6379 lies in the region of Cassiopeia. Cassiopeia has a name that seems made to be spoken softly. Its figure invites us to imagine a seat before the immensity, and enough time to contemplate it.

Figures in the sky are a human way of approaching immensity. In our gaze they join lights that may lie at very different distances. Imagination stretches the thread; the stars provide the brightness. A single landscape can therefore keep old images while receiving a story that begins tonight.

Its light, among other lights of the constellation.

An early super-Earth from the Eta-Earth survey

Keck-HIRES measurements collected from 2001 to 2008 revealed a repeating Doppler signal from the K0 dwarf HD 7924. In a paper posted on 28 January 2009, the NASA-UC Eta-Earth team reported a planet with a minimum mass of 9.26 Earth masses and a 5.398-day orbit. Photometric monitoring at Fairborn showed that the star varied by only 0.19 millimagnitudes at the radial-velocity period, supporting the planetary interpretation. The authors called it the first low-mass planet to emerge from the Eta-Earth Program.

At the time, HD 7924 b was one of only eight known planets with minimum masses below ten Earth masses.

We can imagine that small entry resting on a desk while another night gathered outside. A few written marks were enough to keep a meeting with the sky from passing entirely away. Reading them now, we receive a little of that attention. The star becomes more than a point on a chart: it offers a place where an earlier gaze and our own can quietly meet.

The time of stars

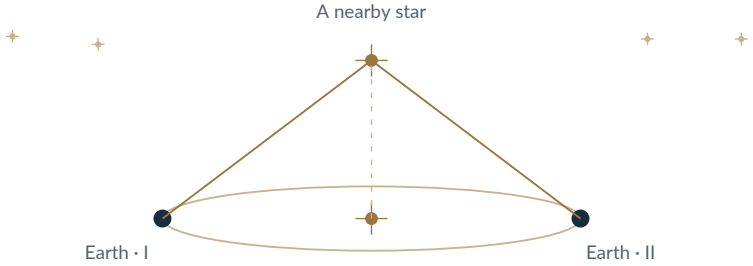

Every star has a rhythm shaped by the matter with which it was born and the stage of life it is passing through. Some spend their light intensely; others sustain it for much longer ages. We can imagine them as a library of different times, where no story needs the same length to deserve being told.

To approach HIP 6379, we can let that scale widen our imagination. A stellar age is unlike a birthday: it speaks of changing matter, of energy finding a way out, of a balance sustained and transformed. Tonight's light is one page of that time, and we happen to be here to receive it.

Measuring with two glances

To begin measuring a stellar distance, Earth offers us a movement. We observe from one side of its orbit and look again about six months later from the other. A nearby star seems to shift slightly against more distant ones. That small change of perspective is called parallax.

We can feel the principle by looking at a finger with one eye and then the other. What fits between two glances at home requires our planet's journey in the sky. There is something beautiful in that patience: to learn how far a light is from us, we first learned to look from somewhere else.

Two positions of Earth, six months apart.

Nothing stands still

Although it seems still, HIP 6379 belongs to a moving sky. Stars travel through the galaxy and our own home moves with the Sun. The distances are so great that many of these changes need years of observation to become visible. The serenity we see is really keeping a journey.

We can imagine every night as a meeting between travellers. We arrive with one more day of memories; the star arrives with its light and its path. The meeting seems to repeat, yet it is never quite the same. Perhaps that is why looking again can be such a simple way to celebrate shared time.

The night of finding it

We can begin with something simple: looking into a starry sky and letting our eyes grow used to darkness. The dedication page lets us choose a place and time to find where to look. Recognising the constellation first turns a distant map into a familiar landscape.

If a telescope joins the evening, a wide field is a gentle beginning. As a reference, a 114 mm Newtonian with a 500 mm focal length gives 20× with a 25 mm eyepiece. The star remains a point of light; the instrument gathers more of its brightness. The best memory may be the moment we leave the eyepiece and say: there it is.

Somewhere to return

We can close this booklet and let HIP 6379 become a small light in an enormous night again. Something, though, will have changed. We now know part of its journey, a shade of its colour and a way to find it. What seemed far away has a place in our memory.

There will be clear nights and others when clouds keep the sky. Not every night will allow observing, but each can bring back the memory of this gesture. Sometimes a name is enough to return to a date, a voice, a few shared words. And when the light appears again, we will have one more reason to pause and look.
