HIP 10339

One light among many

Some nights begin when we stop hurrying. The day withdraws, our eyes learn the darkness and, little by little, the stars appear. Among them is HIP 10339. Until now it may have been another distant light; pausing to look is the beginning of giving it a place in our own story.

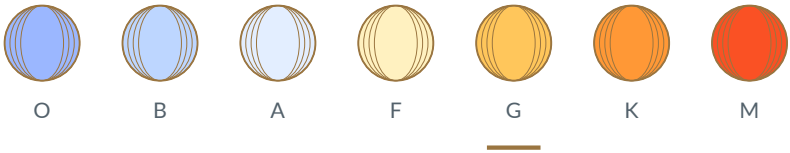

A dedication begins with that simple gesture: choosing something beautiful and wanting to share it. The star will continue on its way, beyond our calendars, while here below its light can accompany a date, a name or words we wish to keep. Immensity takes on an intimate measure: the measure of what matters to us.

The colour of its fire

The light of HIP 10339 has a character of its own. The G family feels familiar because the Sun belongs to it too. We can imagine a brightness related to the light entering a window and accompanying our days. Elsewhere in the sky, matter has found a way to shine that reminds us of home.

To the unaided eye, a stellar colour can be little more than a whisper. The atmosphere makes it tremble and our eyes receive it in their own way. Beyond that point we can imagine a living surface of hot matter: the visible beauty of processes working on a scale far greater than ours.

SEVEN FAMILIES OF LIGHT

Light keeps the colours of its origin.

The journey ending here

The light of HIP 10339 crosses approximately 83.4 light-years to reach us. The brightness we receive has therefore spent about 83.4 years on its way. Distance becomes time: looking at this star means meeting light that began travelling before this moment. When it set out, the Sun and its planets already shared a history billions of years old. On their scale, this journey is barely a breath.

Its light travels on something like the scale by which we count a life. While it moved, streets changed, trees grew and many stories found their beginning. In a single glance, the star lets us receive something that has crossed years of the world.

THE JOURNEY OF LIGHT

Its origin Here

From its sky to our night.

A landscape for imagination

HIP 10339 lies in the region of Andromeda. Some names seem to wait for a voice across the night. Andromeda invites us to imagine that meeting: a distance that ceases to feel lonely when someone looks up.

Figures in the sky are a human way of approaching immensity. In our gaze they join lights that may lie at very different distances. Imagination stretches the thread; the stars provide the brightness. A single landscape can therefore keep old images while receiving a story that begins tonight.

Its light, among other lights of the constellation.

V451 And in the Young Solar Analogs Project

CDS/SIMBAD identifies HIP 10339 as HD 13531A, also called V451 And. Gray and colleagues' Young Solar Analogs Project began in 2007; its first paper lists HD 13531 (G7 V) as one of the monitored stars. In the multi-year study, HD 13531 shows significant seasonal variation in the Mount Wilson S index, a measure of chromospheric activity: Table 5 reports a null-hypothesis probability below 10^{-5}. Section 5.3 also includes it among stars with significant 2–4 year periods in a Lomb–Scargle analysis.

Behind the record, we may picture the simplest astronomical gesture: someone looked, stayed a little longer, and chose to remember. The instruments and pages have changed, but that gesture remains close to us. Tonight we can give it a personal meaning, finding in one distant light a place for the words, dates and shared moments we wish to keep.

The time of stars

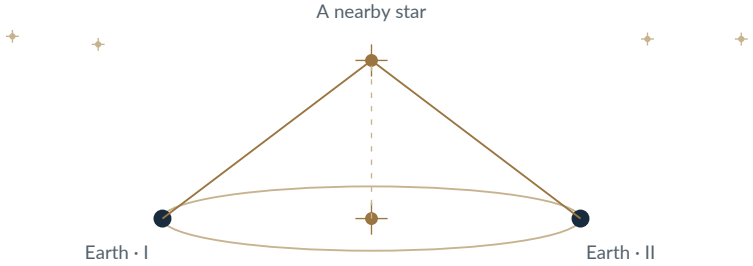

Every star has a rhythm shaped by the matter with which it was born and the stage of life it is passing through. Some spend their light intensely; others sustain it for much longer ages. We can imagine them as a library of different times, where no story needs the same length to deserve being told.

To approach HIP 10339, we can let that scale widen our imagination. A stellar age is unlike a birthday: it speaks of changing matter, of energy finding a way out, of a balance sustained and transformed. Tonight's light is one page of that time, and we happen to be here to receive it.

Measuring with two glances

To begin measuring a stellar distance, Earth offers us a movement. We observe from one side of its orbit and look again about six months later from the other. A nearby star seems to shift slightly against more distant ones. That small change of perspective is called parallax.

We can feel the principle by looking at a finger with one eye and then the other. What fits between two glances at home requires our planet's journey in the sky. There is something beautiful in that patience: to learn how far a light is from us, we first learned to look from somewhere else.

Two positions of Earth, six months apart.

Nothing stands still

Although it seems still, HIP 10339 belongs to a moving sky. Stars travel through the galaxy and our own home moves with the Sun. The distances are so great that many of these changes need years of observation to become visible. The serenity we see is really keeping a journey.

We can imagine every night as a meeting between travellers. We arrive with one more day of memories; the star arrives with its light and its path. The meeting seems to repeat, yet it is never quite the same. Perhaps that is why looking again can be such a simple way to celebrate shared time.

The night of finding it

We can begin with something simple: looking into a starry sky and letting our eyes grow used to darkness. The dedication page lets us choose a place and time to find where to look. Recognising the constellation first turns a distant map into a familiar landscape.

If a telescope joins the evening, a wide field is a gentle beginning. As a reference, a 114 mm Newtonian with a 500 mm focal length gives 20× with a 25 mm eyepiece. The star remains a point of light; the instrument gathers more of its brightness. The best memory may be the moment we leave the eyepiece and say: there it is.

Somewhere to return

We can close this booklet and let HIP 10339 become a small light in an enormous night again. Something, though, will have changed. We now know part of its journey, a shade of its colour and a way to find it. What seemed far away has a place in our memory.

There will be clear nights and others when clouds keep the sky. Not every night will allow observing, but each can bring back the memory of this gesture. Sometimes a name is enough to return to a date, a voice, a few shared words. And when the light appears again, we will have one more reason to pause and look.
