HIP 117020

One light among many

Some nights begin when we stop hurrying. The day withdraws, our eyes learn the darkness and, little by little, the stars appear. Among them is HIP 117020. Until now it may have been another distant light; pausing to look is the beginning of giving it a place in our own story.

A dedication begins with that simple gesture: choosing something beautiful and wanting to share it. The star will continue on its way, beyond our calendars, while here below its light can accompany a date, a name or words we wish to keep. Immensity takes on an intimate measure: the measure of what matters to us.

The colour of its fire

The light of HIP 117020 has a character of its own. In the M family, red seems to keep the last colour of sunset. These surfaces are relatively cool among the familiar stellar families. The same tint can clothe very different bodies: colour opens the story while leaving much still to discover.

To the unaided eye, a stellar colour can be little more than a whisper. The atmosphere makes it tremble and our eyes receive it in their own way. Beyond that point we can imagine a living surface of hot matter: the visible beauty of processes working on a scale far greater than ours.

SEVEN FAMILIES OF LIGHT

Light keeps the colours of its origin.

The journey ending here

The light of HIP 117020 has a journey behind it. Before touching our eyes it has crossed space, carrying the trace of its origin. The sky is filled with arrivals: every point appearing in the darkness offers a meeting with another place and another moment.

Perhaps that is one of distance's gentlest gifts: allowing something born far away to become part of what is close. While the Sun carries its planets around the galaxy, we keep receiving these silent messages. Night gathers the journeys; our gaze gives them somewhere to arrive.

From its sky to our night.

A landscape for imagination

HIP 117020 lies in the region of Pegasus. Pegasus brings the road and flight into one image. We can imagine it rising from familiar ground, like wishes that begin close by and end by opening the whole horizon.

Figures in the sky are a human way of approaching immensity. In our gaze they join lights that may lie at very different distances. Imagination stretches the thread; the stars provide the brightness. A single landscape can therefore keep old images while receiving a story that begins tonight.

Its light, among other lights of the constellation.

An address written in light

In 1997, ESA's Hipparcos Catalogue gave HIP 117020 a precise place in a map built from light. Behind that line of figures lay years of looking from space: the patience of returning to a star and recognising its tiny change of position. Its entry keeps a parallax of 3.99 ± 0.80 milliarcseconds, V magnitude 5.09 and spectral type M2III. These are the traces by which a distant presence becomes recognisable, an address to which our gaze can return.

We can imagine that small entry resting on a desk while another night gathered outside. A few written marks were enough to keep a meeting with the sky from passing entirely away. Reading them now, we receive a little of that attention. The star becomes more than a point on a chart: it offers a place where an earlier gaze and our own can quietly meet.

A life opening out

The word giant speaks of a star that has moved beyond the appearance of its first long stage. Its envelope has expanded and the interior has changed the way it supports itself. We can imagine a life opening its rooms, a light taking up more space while writing a different chapter of its story.

To approach HIP 117020, we can let that scale widen our imagination. A stellar age is unlike a birthday: it speaks of changing matter, of energy finding a way out, of a balance sustained and transformed. Tonight's light is one page of that time, and we happen to be here to receive it.

Measuring with two glances

To begin measuring a stellar distance, Earth offers us a movement. We observe from one side of its orbit and look again about six months later from the other. A nearby star seems to shift slightly against more distant ones. That small change of perspective is called parallax.

We can feel the principle by looking at a finger with one eye and then the other. What fits between two glances at home requires our planet's journey in the sky. There is something beautiful in that patience: to learn how far a light is from us, we first learned to look from somewhere else.

Nothing stands still

Although it seems still, HIP 117020 belongs to a moving sky. Stars travel through the galaxy and our own home moves with the Sun. The distances are so great that many of these changes need years of observation to become visible. The serenity we see is really keeping a journey.

We can imagine every night as a meeting between travellers. We arrive with one more day of memories; the star arrives with its light and its path. The meeting seems to repeat, yet it is never quite the same. Perhaps that is why looking again can be such a simple way to celebrate shared time.

The night of finding it

We can begin with something simple: looking into a starry sky and letting our eyes grow used to darkness. The dedication page lets us choose a place and time to find where to look. Recognising the constellation first turns a distant map into a familiar landscape.

If a telescope joins the evening, a wide field is a gentle beginning. As a reference, a 114 mm Newtonian with a 500 mm focal length gives 20× with a 25 mm eyepiece. The star remains a point of light; the instrument gathers more of its brightness. The best memory may be the moment we leave the eyepiece and say: there it is.

Somewhere to return

We can close this booklet and let HIP 117020 become a small light in an enormous night again. Something, though, will have changed. We now know part of its journey, a shade of its colour and a way to find it. What seemed far away has a place in our memory.

There will be clear nights and others when clouds keep the sky. Not every night will allow observing, but each can bring back the memory of this gesture. Sometimes a name is enough to return to a date, a voice, a few shared words. And when the light appears again, we will have one more reason to pause and look.
